70 Solutionsto Exercises Problem Set 41, page 202 1 Both nullspace vectors will be orthogonal to the row space vector in R^3 The column space of A and the nullspace of A^T are perpendicular lines in R^2 because $\text{rank} = 1$ 2 The nullspace of a 3 by 2 matrix with $\text{rank} = 2$ is Z (only the zero vector because the 2 columns are independent) So $x \cdot n = 0$, and row space = R^2

Linear Algebra and Its Applications (Fourth Edition)

Linear algebra moves steadily to n vectors in m -dimensional space We still want combinations of the columns (in the column space) We still get m equations to produce b (one for each row) Those equations may or may not have a solution They always have a least-squares solution The interplay of columns and rows is the heart of linear algebra

Introduction to Generalized Linear Models

Introduction Generalized Linear Models Structure For example, a common remedy for the variance increasing with the mean is to apply the log transform, eg $\log(y_i) = \beta_0 + \beta_1 x_i + \epsilon_i$ $E(\log Y_i) = \beta_0 + \beta_1 x_i$ This is a linear model for the mean of $\log Y$ which may not always be appropriate Eg if Y is income perhaps we are really interested
